CLASS: J.S.S. 3

ESSAY TOPIC:

“IF I COULD INVENT SOMETHING NEW”

I always wish to see the snow fall in Nigeria but it cannot be possible due to its tropical region and to make a device that could change the weather for the benefit of every Human Being “Super Computer Latest Series”.

I was inspired by the fact that in some places in Nigeria we have problems in climate which are sometimes beneficial and harmful to the environment. Like in the Northern part of Nigeria, they suffer a lot due to their climate condition more than the southern part of Nigeria. During their dry season, they have little or no rain and some of their crops are being scorched by the sun and this leads to low quality and production in certain crops. If I could use a device to make rain to fall as much as they need it during the dry season it will enable the crops to fertilize, grow and produce quality products.

The device would be a super computer but with a higher capacity that will go deeper into the orbit than that of the computer which is used for weather fore-casting and would be working like the rocket. A Frequency Generator, capable of generating a frequency that can vibrate the molecules of an already formed cloud. The frequency generated acts as a catalyst that causes the cloud molecule to react with the atmospheric gas. More like a chain reaction, causing the cloud molecules to move as it reacts with the gas in the atmosphere. From a scientific view, when you look at a book with your naked eyes, the book does not move but using a particular microscope, it shows you that there are molecules on the book and you will clearly see through the microscope that the book is moving by the vibration of those molecules.

Applying it to the atmosphere the device would be a super computer like the **MIHIR**, a 2.8 petaflops super computer but with higher capacity which will show and tell you that a cloud is forming in a particular area and that area have had rain for more than a month so the device will attract the molecules and channel it to a place without rain which is to say the device acts as a catalyst which speeds up the rate of reaction, the molecules in the air around the cloud vibrates and moves in the direction where the rain is channeled. Therefore, as it moves, it adds and subtracts till it gets to the area where the rain is channeled to fall and a rainfall occurs.

In conclusion, this invention will be a huge contribution to the world, as it has no side effects but this can only be achieved by a lab research using certain materials that can create objects like the Unidentified Flying Object {UFO} and a scientific lab that makes the production of my device possible.
