

NAME OF STUDENT: MINAGBELAMA MALACHI IBITAMUNO
NAME OF SCHOOL: BAPTIST HIGH SCHOOL, PORT HARCOURT, RIVERS STATE
CLASS: J.S.S 3
AGE: 13YEARS

IF I COULD INVENT SOMETHING NEW

If I could invent something new, I would invent a teleportation device that will help solve problems associated with transportation and make transportation faster and easier. The world is faced with so many challenges which slow down the running of the day-to-day activities of man. Many scientists and inventors have tried to create and invent machines which would increase the speed and qualities of man's activities.

Inventions are creations or new devices resulting from study and experimentations. These inventions take a lot of brain work, understanding and skills to be able to solve man's problems and make his activities easier. They include; cars, ships, refrigerators, etc. with all these inventions and machines, man is still facing challenges in his day-to-day activities. These challenges can be reduced in the transportation sector with the invention of the teleportation device.

Transportation is one of the problems faced by man even with the evolution of cars, ships, trains and air-planes, man still needs something faster, easier and with less side effects. A teleportation device is a gadget that allows characters to move instantaneously from one location to another without physically travelling the distance in between.

A feature of this invention is its ability to convert the matter and energy of the object it wants to transfer into a transferable form, transmit the information to the destination and then reconstruct the object at the target location.

It will also be to accurately pin-point the right destination to avoid mistakes, conserve the total mass and energy of the transported object to ensure nothing is lost or gained and it may rely on quantum entanglement to transmit information about the object.

The teleportation device has so many advantages. Firstly, it would reduce the carbon foot-print associated with transportation as it would not need vehicles that rely on fossil fuels.

Secondly, in emergency situations, teleportation would allow for rapid response and quick transfer of people in cases of fire outbreaks and natural disasters.

Thirdly, it ensures safe travelling of people, their belongings and other objects as there will be no risk of robbery attacks, kidnapping, road accidents, plane crash, etc.

Lastly, it would save up a lot of time used to travel long distances for more productive purposes.

Few disadvantages of this device include: teleporting into dangerous areas by accident and the misuse of this technology.

In conclusion, this device would help to transport people and objects easier from one place to another and change this stressful atmosphere filled with traffic jams, road accidents, pollutions from vehicles and time wastage. This invention would ensure a less stressful and better living environment for all.
