

NAME: AGBO MUNACHIMSO PENIEL

SCHOOL: FEDERAL SCIENCE AND TECHNICAL COLLEGE, OROZO, ABUJA

CLASS: JUNIOR SECONDARY SCHOOL 3

IF I COULD INVENT SOMETHING NEW

What is inventing? Inventing is to think of and plan something completely new that did not exist before. If I was to invent something new I would create an automatic travel machine that can take people or goods to a far distance in a few seconds, depending on how you set it, just by disappearing from its location and appearing in a new set location. This machine could be set to take a luggage or a person to a one kilometer distance, in just one second and it will achieve it.

Think about when you have an important assignment somewhere far from your destination and you have to be physically there and can't miss even a second. Instead of running around looking for a vehicle to take you there, you can just enter your automatic travel machine and it will take you there immediately. This device can help people overcome the challenges of movement, due to transportation difficulties and affect businesses, positively.

This machine will have a compartment, where people can enter or goods loaded and will work with something like Google map, to find locations, accurately. It will also be able to understand and interpret human languages, and have an interface, where it can display information or commands given to it, for assessments and corrections, before take-off. It will be a rechargeable machine, with a long lasting battery, that can be charged, using electricity or solar.

There are many challenges posed by time and distance that this machine can solve. It can be deployed to improve healthcare delivery, remove bottlenecks posed in our education and other aspects of our lives, by transportation problems, and reduce general cost of living. The automatic Travel Machine will bring peace to the user, by reducing cost, communication difficulties, crowd and violence.

However, there should be a strict regulation to avoid misuse and abuse. It will also be designed to be able to detect obstacles on its way and avoid it, because of accidents and collisions with other machines or humans.

Finally, this Automatic Travel Machine will save time, energy and work required to move people or goods from one place to another. It will bring and improve business opportunities and help in revolutionizing our society.
