

IF I COULD INVENT SOMETHING BY AMINU ALIYU AHMED

YEAR 8.

My invention will be about something that has to do with medical health because there are many sick people living among us. It will be a micro robot that is injected into the body and it will travel around the body so if anybody is sick the robot will detect and terminate the sickness. Also, the micro robot will produce more white blood cells. If you have an injury or a cut or if you are involved in an accident and lose blood, the robot will freeze the wound and close it up. For patients who do not have enough blood, the robot will produce more blood. No matter the nature of sickness the robot will be able to provide a cure or treatment to the patient.

Also, I will invent a special software that is a robotic pill or medicine that can help in the body and will be given to everybody, the way immunization is given, the pill will be able to prevent all forms of cancer, hepatitis and the likes.

In critical medical cases like heart failure or when a patient is in coma, the patient will be placed in a machine that will always inform the doctors of any changes by sending a message to a device on the doctor's wrist. The doctor can then send a program to the machine that will take necessary measures in attending to the patient, then in cases where the doctor has to attend to the patient himself, he will go in person.

I will also invent different machines and drugs that will treat different parts of the body; the brain, the heart, the veins, the muscles and the inner part of the skin. If the patient does not like the idea of injection, it will be consumed by absorbing. The drug will be placed on the body and a liquid activator will be dropped on it and the skin will absorb the drug into the body.

My invention will boost life physically and mentally and will improve memory and knowledge and also help us to grow and increase life span of people.

Thank you.
