### **IF I COULD INVENT SOMETHING NEW**

If I could invent something new, I would invent a care robot. Care robots are robots designed to help people out. Care robots come in various shapes and sizes, some are meant for physical care, including machines that can help lift old people if they are unable to get up by themselves, assist with mobility and exercise, monitor their physical activity.

There are meant to detect falls, feed them and help them to take a bath or many other things. So if I could invent a care robot I would invent a robot that would help the sick and elderly people. Imagine if you had a meeting, event or place to attend to but your child, wife or any member of your family was very sick. A robot like this would take care of them and protect them while you were gone. It would serve as a caretaker on serve no matter when.

It can also be of help if you have an old mother or grandparents thinking there will need a little help here and there. A lot of elderly and old people don't like to stay at retirees homes because they still want to be independent as there were few years ago. The care robot would help them so they can still feel better and independent, because you now know that your older family members would now be looked after properly.

The robot is something that you can name yourself and it would become like a part of your family. It would be there to take care of sick and elderly people when they need help and assistant, and protect them from any harm. It would be an amazing invention for a family to make. It would be of help around house, on top of taking care of you and your family member.

The amazing care-taker will help you out no matter what, and you go to anywhere you need to go to without worrying a bit about your child, old mother, or your grandparents.

That is the reason I would invent a robot like this to help the world.

Thank you.
