

Name: Chiamanda Ezenwa Lois

Class: JSS 1

School: St Louis Secondary School, Bompai, Kano State.

Age: 11 years

ESSAY ON IF I COULD INVENT SOMETHING NEW

When I was a baby, probably 5 years old, I used to believe all that could be said by man was completely true. My dad will be like “I will get you the aeroplane you asked for”. This was after series of request, I made whenever he went out for work. I waited in full anticipation, eagerly waiting for my brown new private jet. Oh! It wasn’t forth coming. Surprisingly, my dad kept promising. I still never lost hope until after I clocked 8 years. “you known an aeroplane is very expensive”, said by a friend of mine Emmanuella since then, I gave up completely still it kept occurring in my heart, why could my dad couldn’t tell me it was so expensive and he could not afford it. What! So much years I wasted believing in the heart of man? How I wish I could read and detect man’s heart like the thought.

Clocking eleven years, I began to understand fully why something’s seems difficult. I imagined why fake promises could be made without fulfilling. I also imagined why people go extra mile to kidnap fellow human. I further imagined why people kill at the expenses of achieving vain things of this world. My concern since then, was to know the happenings of man’s heart. I am so curious to know how man think and what man thinks before action. I vastly believe that this could solve a lot of problems all over the world. My limit to the heart of man (human) is the fact that it is only located in the thoracic cavity. As for the content, I don’t know then how could I know and detect the activities in man’s heart? This question kept hitting me so hard.

Luckily, early this year, precisely 5th January, 2024. I came across programming in ICT. I was so curious to know about it. I learned people have done greatly in information technology. I learned we could instruct computer to perform some task like robotic machine. Some aspect of the computer is weather forecast, reading and taking note of body temperature etc. I also heard about Artificial Intelligence (AI).

The question in my heart still persist. How could I know and detect man’s thought? I came across some programming languages like python, C++, java script etc.

Then, how could I still know the thought in man's health? I think if I could learn more about Artificial Intelligence, I could invent a device that can read and detect man's thought. This could be achievable if I engage myself learning more about programming.

I requested for a laptop from my mother and hope it will soon be provided. I think I could start something from the available resources. I aspire to become a computer software engineer.

Lastly, it could be of help globally if a device that could be invented. I strongly believe that my dream will come to pass some days. I will name my device PURE HEART DETECTOR.
