

My name is Amike Arnold, and this is my essay.

If I could invent something.

If I could invent something, I would had invented a car that has never a car that has never been made before. It will have six seats and it will be a car that can drive on water, and it will not use fuel. It will be using any liquid substance like water because a lot of people do not have money to buy fuel.

So this car will use water as fuel because, it can stop anywhere and since it walks on water and land that that wouldn't be a problem. So this car would help mankind because, they will be a phone in the car, that no matter where you are there will be a signal, and the fuel scarcity will stop. So the main benefits of this car is that, you can travel abroad easily with it. Some cars when they want to travel to a state, it takes a huge amount of money to fill it up with fuel and you can't travel abroad with it, and they are other expenses in the car, but this car won't need any of that, it's because it's like a boat but smaller, and a device is there in the car that can tell you if a boat or a ship is coming your way.

If you want to travel by plane, you would have to buy visa and a seat and a lot of people don't have that much money to pay for it. So this car would not need money to travel, you just need water to fill it up. They would be cameras around the car and it will linked with the owners phone, so if anyone is trying to enter the car with the owners permission, they will be a red light, so when the owner sees the red light on his phone, he can raise an alarm through his phone. And the phone in the car will signal the near by police station for help.

There will be a radio that you can use to download any song you want. And if you want to open the car, you can either use the car keys or your fingerprint to open it. If you want to open the car you can use a voice recognition or simply use the car keys. The car can be used to save people when they are seen drowning. And there is a tablet that at the back seat that had all apps and you can do anything with the tablet, even the young one could watch educational videos on it.

It is a self-driving car, it helps make the car drive on its own. It also has propellers so that it will be fast when driving on the sea, and if there's a heavy rain there's a sunroof that could protect the car. So if I could invent something, that will be my invention.
