### **IF I COULD INVENT SOME THING NEW**

I would invent a machine that can automatically pick up litter and make the air cleaner. This idea is inspired by the global issue of new discovery of diseases that are transferred from one person to another.

Such disease like corona virus, tuberculosis, cholera etc would be reduced or even prevented and thereby improving the world economy. 2019/2020 was economy was jeopardize by the Covid-19 virus. Earlier, chickenpox, influenza, whooping cough, Respiratory syncytial virus, mumps, measles were all discovered and each of these affected the world economy before their cure could be discovered. Situation like this can be averted if such technology is put in place.

The proposed technology would pick up any litter and harmful virus in the air and automatically neutralize such, hence making the air cleaner. The technology will be made in a way that it automatically sucks in air through a fixable pipe.

Especially the harmful litter in that air and purifies the same by neutralizing all the harmful component of their air and releases the air back for human use. All this would be done in one second and continually to keep the air in the environment clean.

The technology will be made available for use in public places like mosques, churches, schools, hospitals, sores and other places that are enclosed. Especially in those public places where people find it difficult to stay 2-3 meters away from each other and still conduct their business effectively and productively.

This technology will be made to work together with or alongside already existing technology like air conditioners and air ventilators so as to totally achieve the purpose of maintaining clean air wherever needed. This does not mean that the air cleaner will be dependent on any of the afore mentioned already existing technology. It will still work alone.

Although, the use of facemasks and hand sanitizers is encourage these alone cannot win the battle against this airborne disease because these (facemasks and hand sanitizers) does not fight the virus from the root. Also it is not encourage wearing facemasks for too long as that can affect the human health badly.

As longs as human exist and continues to interact with each other in their environment, humanity remains at the risk of airborne disease. This brings the need to look for a way to put an end to diseases and viruses that can be spread through air so as to keep us safe from airborne diseases since humans as living things cannot sun live without air.

If this technology is invented, it will put a curb on infection both of already existing airborne and any other new ones that might be discovered subsequently.

This proposed technology if invented would help the government and humanity in all parts of the world. It will help keep the world economy safe and situation like that of 2019/2020, where so many countries had to lock down respectively as a result of disease and infection will be averted.
