IF I COULD INVENT SOMETHING NEW

Recently, I have been brainstorming about what I could do to improve the society. From research, it has been found that increase in the earth temperature due to human activities: which is called global warming: has been affecting the world in many ways. The warmer weather temperatures over time are changing weather patterns and destroying the usual balance of nature and this poses many risks to human beings and all other forms of life on earth.

I have decided that if I could invent anything at all, it will be a device that would reduce or collect the harmful gases that are causing this global warming and find a safer way to dispose them of or maybe turn them into something new and harmless. As greenhouse emission blanket the earth, they trap the sun's heat and now the world is warming faster than at any point recorded in history.

Here in Nigeria, the weather conditions are becoming unbearable joined with hardship, strife and everything, it has not only affected our skin and burden but also our mindset, emotion, temperament, agriculture and many more. We noticed that our temperament go up with the weather change, we get angry over little things, we feel stressed out and dehydrated over little work and at times we tend not to think straight anymore.

Many people have invented many things but not all have taking this life changing invention to mind. With hotter temperatures, more severe storms, increase drought, unyielding crops and others, I think this should be a priority to many scientists out there in the world.

I would like to invent a device with a very strong capacity that will be in the sky to absorb any harmful gas that is in the atmosphere. Gases are the most primary cause for global warming so if this device can absorb the gases and another solution of chemicals are added to it to create safe and helpful gases and are latter released into the atmosphere, then I think that will be a reliable impact. If gases and chemical started the issue, I think they should be able to stop it so I would say we are fighting fire with fire.

Not all gases or chemicals are harmful to the environment. In fact some of them are needed for us to go on with our daily life so if can transform these harmful gases into something helpful, the whole earth will benefit from it and life will get easier.

I hope that one day this dream will be achieved and the world will finally be a better place for us to leave in without fear of the things of the things unknown.
