IF COULD INVENT SOMETHING NEW

We all wish to see the stars up close, if I could invent a device that changes the world, I would like to invent a device that will enable us to see the stars up-close, the device would be like a spec which we all know as a glass it will be comfortable on the face, it will be like a fashion accessories. It was galileo who inspired me because he was the first person to invent the telescope.

The features of the device is beneficial because we will be able to see the stars both early in the morning and at night. Instead of us to take a trip to the moon so as for us to see the galaxy up-close (Space). It can also help people that cannot afford to travel to the moon, it can also help the children that want to become an astronaut in future to study its advantages and disadvantages. It can also enhance the study of a scientist i.e. the study of gravity, longitudinal and latitudinal extent of any country.

Galileo improved the design of the telescope every year and applied it to astronomy, in 1611 johannes kepler, after him Isaac Newton created the first reflector for the telescope in 1688, Lauren Cassegrain was also involve in inventing it in 1672. The main purpose of telling you all about then is because they all have reasons for inventing this machine, for me it can help the needy because many don't have money to put their children in school why some of those children want to be an Astronaut, some want to become Scientist, some just have interest in it, in which everyone need to have a chance to study God's creation.

If by any chance I make this device and if it is profitable, the money would go straight to charity so as to help needy children achieve their dream.
