

If I Could Invent Something New.

An invention is an idea of a person to create a certain thing or machine to better human life. If I could invent something new, I want to invent a drone connected to special glasses and gloves to control it. A drone is a special machine used to take pictures and videos from a far distance or a high distance. My drone will be connected to some specially made glasses so that when the drone is turned on, the glasses will be activated and you can see where the drone is going with the glasses. And to control the movement of the drone, gloves will be connected with an antenna from the drone so that wherever the gloves are waved to the drone will move there.

The drone will work by turning it on and the gloves and glasses will also get connected automatically. To lift the drone, you put your hand wearing the gloves to face the ground and begin to lift the hand off the ground so that the drone will start going up. To make the drone go forward, you squeeze the hand wearing the gloves and the drone will go forward and to reverse the drone, you spread your palm out wide and it will reverse and if you want to land, you spread your palm out wide facing the ground and it will land.

The materials needed for making my drone is a switch, metal for the body, motherboards, rotor, propellers, camera, antenna, lens, glasses, and gloves. To make the drone take pictures, you press the thumb and index finger together once, and to make the drone shoot a video, you press the thumb and index finger for five seconds and it will start shooting the video and to cut the video, press the thumb and index finger again for 5 seconds to stop videoing and save.

This drone I am about to make has a lot of uses and it is going to help in lots of work like agriculture, deliveries, highway monitoring, inspection, rescue, photography, wildlife monitoring, commercial work, construction work, geographical location, buildings surveying, crop spraying, and also help in military work.

This drone can also be programmed by switching the lever on the body of the drone down to meet home needs. The drone can complete tasks in homes quickly. It also means less stress and hassles. The drone can also do tasks that can be dangerous for humans to do like cleaning the top of a shelf and changing a light bulb. It can also help in homework and school projects. It can also organize the house by making use of its sensors and robotic hands to put away toys and books and other items too. It can also help with chores and reduce workload for parents.

In conclusion, this drone can also be used to make life easier in aspects like photography by taking pictures and videos from a far distance and I am sure that if I am successful in inventing this, life will be more easier and better for us all.
