An invention is the act of using multiple ideas to make something that is beneficial to everyone. The act of making a new invention that will be beneficial to everyone means making a device or machine that will be beneficial to the health of every individual because of the adage that say health s wealth

A disease called AIDS was recognized in the year 1981 by a scientist called Luc Antione Montagines. This disease is very dangerous and had cause the death of a lot people across the globe. This disease is first developed in the body as HIV which when not treated called AIDS.

AIDS which fully means acquired immunodeficiency syndrome attacks the immune system and weakens it. Then the body get prone to oppportunistic disease which arises due to the weakness of his or her immune system. This virus is carried out in body fluids, sperm, breast milk and vagina discharge

In the US, 46,134 AIDS patients died of this disease. however, on march 1987 a drug called antiretroviral is used to managed this deadly disease. antiretroviral drugs contain efavirenz, nevirapine, etravirine, doravirine and rilpivirine.

After the effort of many scientists, there is no cure for HIV/AIDS infections. So if I was to make a new invention I will invent a device that can cure HIV/AIDS. A Jesuit Priest John Powell said that happiness is an inside job. So many people are so worried because the cure for this disease is not yet discovered. If a device can cure this disease, it will bring more happiness to the world. The death of HIV/AIDS patients will be reduced. This device will contain two times the antiretroviral family

If I could invent a new device that can cure this disease. it will prevent millions of death, improving the quality of life for those affected and their families, this device will potentially stop the spread of HIV ending the epidemic. This device would help reduce stigma associated with HIV/AIDS, promoting greater awareness and understanding. This device will not cure HIV with the use of tablets or syrup, but will be situated in a science lab where doctors, lab scientist and other medical professionals can attend to HIV/AIDS patients. This will be situated in every hospitals around the world in order to quickly eradicate this disease.

The device will not only eradicate HIV/AIDS it will also have impact on the economy by reducing health care costs, increase productivity ad boost economic growth. It will improve mental health by alleviating the emotional burden and anxiety associated with living with a life threatening conditions.it would also have a great impact on global health progress. It will be a significant milestone in the history of medicine.
