If I could invent anything, I would invent a machine that can automatically pick up litter and make the world cleaner and less polluted

This idea was inspired by the global problem that we face with keeping the earth and having responsibility for it. This machine will also help us to reduce some of the global issue that we face all around the world.

We face a lot of global issues like air pollution, and climate change as a result of releasing harmful gases in the environment. Inventing this machine will help provide a new and clean environment for people to live in and reduce the spread of diseases through this pollution removing machines, it can help to reduce the rate of pollution.

This machine would also help to reduce the rate of death such as cholera and lung cancer. The diseases that arise as result of pollution of any sort can be eradicated or reduced to the bearest minimum by this machine. Creating this machine will help reduce the rate of death and prolong the lives of plants and animals.

For air pollution, the machine can be converted to a drone and will be used to detect places where pollution is and remove unwanted gases and smokes and later convert them to useful gases like carbon dioxide that plants can use in respiration. The machine can also be converted to a submarine which will move around the water body and clear all the waste and remove oil spillage which would be convert to substances and gases that are not harmful. This would protect the fishes and all living organisms in water.

For land pollution, the machine will be in form of a vacuum cleaner, which can be used to drill holes in the ground and sucks up all the oil spillage in the soil which can cause loss of natural value. For waste pollution, the machine would work as a truck, that is it would be used to gather refuse together that can be cause pollution to land, air and sea's in the world. This has help me inform, understand and educate people on how my invention can help solve the global challenges we face in the world, and help to improve the population of all countries.

During my hypothesis on how to invent this machine, I had an observation that our world is naturally dirty. So, I concluded and had a theory that states that not only my machine help improve the world, but when human start to help reduce the pollution and refuse in our world. Pollution can cause global problems but with the machine the problems would be solved. This machine would be called "Pollution Control".
