

IF I COULD INVENT SOMETHING NEW

My name is Sevo Iyanu, I am 12 years old, a student of Wesley Girls Junior Secondary School and I am in JSS 2 Silver. In today's era, global warming is the most difficult problem in the whole world. As a scientist, I would invent an equipment which will detect the short coming of any event which can be hazardous for our environment. I will name it **EcoGuard Analyzer**. This invention will safeguard the environment by detecting potential hazards. This invention can tell before- hand that certain event can be dangerous for our environment and by that we can stop it and prevent further damage to the atmosphere. By this, the invention will benefit the entire humanity.

Now a day more and more people are using automobiles and fumes out of chemical factories. First of all, directly affect the human health. They also damage ozone layer which can protect us from harmful ultra violet rays. Deforestation has also added to the problem. There are serious attacks from all the sides on nature. Our successors will be in grave problem because there will be more and more natural calamities.

Global warming occurs when carbon dioxide (CO₂) and other air pollutants collect in the atmosphere and absorb sunlight and solar radiation that have bounced off the earth's surface. This has created threats, not only for some endangered species but for all the living beings. There are temperature variations in all the season in every part of the world, for examples, there are lot of Island being formed out of glaciers as a result of high temperature.

This problem needs a quick and effective solution. I think we need such an Instrument which can help us by warning us prior that certain event is dangerous for the environment. So that we can stop such activities before hand and further damage to the earth's ambience can be prevented. For example, if we had a machine which could have told our ancestors that deforestation may lead to such problems, or they might had known the effect of pollution on ozone layer, or the effect of construction of dams on the environment on future generation, they would have not done that. By inventing such an instrument, I would be able to at least delay the natural disasters in coming future.

In conclusion I will say invention of such machine which can detect that particular event can alter the balance in the atmosphere, can safe present as well as the future of humanity. I think it is duty of every human to contribute towards his/her atmosphere. If I could get a chance I would love to protect my surrounding in every possible way.
