Class: Grade 8

IF I COULD INVENT SOMETHING NEW

Imagine a world where a device can transfer human thoughts into actions! My invention, "The Human-Thoughts Translator (HTT)," makes this possible. The HTT is a portable device that resembles an earplug. Through Bluetooth, it is connected to a robot to carry out your thoughts. Isn't it Amazing?!

Don't get me wrong. We know that robots are already in existence but they need to be told what to do by their owners. But how about people who cannot express their needs and wants such as deaf and mute people, unconscious people, babies, etc? They can't talk but they have needs that they think about but are unable to carry out. These are the people that my invention would help.

Here's how it will work. I will use some of my primary beneficiaries to illustrate. Let's say a baby who can't talk yet could wear the HTT, and their thoughts would be sent to the Bluetooth for a robot to understand and help them. That same way, an unconscious person's thoughts can be carried out if they're wearing the HTT and their robot is active. It would also ensure that deaf and mute individuals receive the help they need.

In addition, the HTT can benefit anyone that struggles with procrastination or that has a lot of work to do at the same time which is the case with a lot of people. We will all become more productive even the vulnerable groups mentioned above.

In conclusion, the HTT is an amazing invention that could transform our world, making thoughts quickly executable. Just imagine a world where doable thoughts can be quickly turned into action!
