If I Could Invent Something New

If I could invent something new, it would be an analytical device that converts thoughts into reality. This sounds like a science fiction but imagine the possibilities with this device rightly termed 'Brainbox'

The device would be installed with a lot of information in various fields of life. It would work by reading brainwaves and transmitting them to the Brainbox which in turn would analyze, calculate, and generate models or strategic steps with which to realistically achieve an actionable solution based on key stroke of collected information. More specifically, it will function like a decoder.

This invention would significantly change industries like healthcare, education and sustainability. Doctors could think of cures and they would have a means to analytically process how to go about it due to the vast information equipped on the Brainbox. In education, teachers could think of topic plans and there will be generated.

There will be a right and wrong consideration to ensure the device isn't used for harm. It will be for humanity and I would be proud to have invented something that brings peoples thoughts and dreams to life.
