Inventions are made to solve problems. They are of great benefit to those who use them so, if I could invent something, I would invent a crime detector. I would love to invent such a detector due to the high rate of crime in Nigeria and the world at large which has continued to overwhelm security agents.

I would name this invention; 'The Crimetect' as it will serve as a crime detector which will be directly used to nab crime. It would be placed in space to enable it view the world and analyze key actions and words to detect distress and report any criminal activity to the security agencies so that they can get to the scene and apprehend the perpetrators.

To avoid cases where the crime detector picks out and pin points ongoing criminal activity but it takes security personnel a while to arrive the scene, the Crimetect will be equipped with power up commands to micro robotic trappers which would be devices equipped to temporarily knocked out persons within the space of the crime occurrence. These robotic trappers would be situated at strategic locations within a community and on been powered by the crimetect, the ones in closest range on ground would roll out to arrest the situation till security agents arrive.

If I can invent this device, it will definitely detect criminal acts and criminals who would likely have continued to commit crimes if they weren't caught and given due punishment. It will ensure a safer environment, country and world. People will be freer to go about their businesses and activities with less fear. It will further build trust, enhance social interactions and relation.

A crime free society will be developed, people will enjoy fundamental rights and the economy will be boosted as foreign investors will invest into the country's businesses.
