**School:** Model His and Hers College, Iju Ajuwon  
**Class:** JSS3  
**Topic:** IF I COULD INVENT SOMETHING NEW

Have you ever imagined a world where your thoughts and ideas could become a reality? As a student and a child, I often think about having to do some things. So, today if I could invent something it would be a teleporter. A machine that can transport objects, or even human beings from one place to another without moving.

It will assist people in their daily lives. It helps students to get to far away schools easily, and it will help patients to get to hospitals without going through the road to avoid traffic which could be critical and may even cause death. They also help market people to transport their goods with ease without stress.

It consists of advanced physics and computer technology. It would have a screen where information will be displayed. It would also need a scanning part, to scan the object or person being teleported. A sender would also be needed to send the information collected to the destination. A receiver captures the data and interprets it, reconstructing the original information about the object or person. Safety rules are essential to prevent accidents, and unauthorised access ensuring the safe and secure operation of the teleporter.

It would work on advanced technologies. It turns out that scanning and resembling teleportation is possible, thanks to the property of this technology that makes this possible. This property starts when two or more particles are forced to hold mutually exclusive states, so determining one simultaneously determines the other

Of course, we must be careful about what we mean when we say teleportation or when using this technology. Teleportation through Wormhole, for something similar, where your body is relocated to another place, such as the Star Trek and Henry Danger, ThunderMan, movie, the kind where one's molecules are disassembled, beamed somewhere else.

The philosophical problem associated with teleportation is the kind where body is scanned, and the information is sent somewhere else and used to build an entirely new body out of different materials. It could cause brain damage and other deformities.

However, great power comes with responsibility. The teleporter could be used by thieves to transport their stolen items easily. Could also help smuggler to transport hard drugs in and out of the state or country without disturbance. It would need a secured boarding point controlled by Government, that users would go to before getting to their destinations. It would also require strict ethical guidelines to prevent misuse. Additionally, the device would need to be designed with safety features to avoid creating harmful or dangerous objects.

In conclusion, the teleporter would be a groundbreaking invention that could transform various aspects of our lives. While there are challenges to overcome, the potential benefit is immense. If I could invent something it would be this device shaping a brighter future for humanity and making the world a better place and comfortable.
