If I Could Invent Something New

If I could invent something that could make a change in the world, I would invent a computer that is solar powered. I believe it is useful in that, it can be powered for operation without relying on electricity.

Solar powered computers primarily, the laptops and cell phones eliminate the need for traditional non renewable energy sources reducing cost and environmental impact.

The use of solar powered cell phones from solar power to charge batteries provide a convenient, suitable and an environmentally friendly solution for powering cell phones and laptops. The use of solar energy will be an avenue to tap into nature to solve an unnatural situation. It will further enhance clean air with no carbon emission or heat trapping greenhouse gases.

The solar charged cell phones would be equipped with mini panels built into the screen and be used to convert sunlight into electrical energy to charge batteries. This will efficiently solve the issue of power outages on phones and laptops which leads to interruption of communication and connectivity.

The world can be an all-around better place with one more invention that helps to better our planet.
