

NAME: DIELE ARISTA
SCHOOL: SONIKA INTERNATIONAL SCHOOLS
CLASS: J.S.S 2
TOPIC: IF I COULD INVENT SOMETHING NEW

To invent means to make or design something new. Nowadays, the world is moving with technology as people work and enjoy different aspects of it. A lot of people have in mind what to invent, while some have already been invented. There are several imaginable inventions that society will benefit from if they are ever invented. Well, if I could invent something new, it would be **a detection machine** that can instantly detect when someone is sick or has a disease.

So many people in the world have diseases unknowingly. These diseases, if not detected on time, may lead to their early graves. With my invention of a detective machine, people will easily detect when they are sick and know the type of disease they have so that they can go to the hospital or anywhere else and get treated; this will make life enjoyable. In a nutshell, it will drastically reduce the mortality rate around the world, often caused by late detection. If my machine is invented, millions of people will spot their ailments or infections easily and get immediate treatment.

In addition, the detective machine will have immense value in addressing emergency situations. In case of a medical emergency, it will be able to detect an individual's disease on time for a sick person to get treatment easily; thus, the rate of death or loss of life will be greatly reduced.

The detective machine will help people prevent diseases from getting worse in them because when people detect diseases with the aid of this device on time, they can then take some drugs prescribed by a doctor or pharmacist to get well before they are hugely affected by them. This device will ensure that help is provided swiftly and accurately.

Of course, the invention of the detective machine will require a great deal of technological innovation, involving advanced artificial intelligence to accurately interpret various kinds of diseases. The benefits of such an invention will be so valuable to human society. Instead of people going to a health care clinic or a hospital for a medical check-up, this device will guarantee such health checkups at their convenience, such as checking blood pressure, heartbeats, and organs of the body whether they are functioning well or not.

In conclusion, the invention of a detective machine will help to instantly detect diseases that can break one down. No one will suffer or die untimely because of an unknown sickness or disease that was not taken care of at an early stage, unless one is negligent in using it. It will be of great help worldwide, and I hope that someday this invention will

become a reality. This will immensely make the world a more connected and safer place for everyone to live in.
