

“If I could Invent Something New”

An invention is a thing or idea that has been invented. Inventing is the use of one's ideas to create what has never been created before or what has not been in existence. One who invents or designs something is an inventor.

The world has developed as a result of the evolution of inventors from the pre-historical age to this technological era. Nowadays, the commonest invention is Artificial Intelligence, the development of a computer system to match the abilities of a human being which has brought about many changes in the way of life compared to past times.

Over the years, the number of deaths stipulated by cancer has increased by a huge margin. This has pushed me to the thought of inventing a machine that would reduce the death toll caused by cancer all over the world. The type of machine I would invent is the chemotherapy machine. It would be used to treat cancer related diseases as well as carry out medical operations on tumors. The machine will be powered electrically by the use of a solar system that would be installed on it. This would keep it functional in the absence of electricity.

My invention would be able to save people's lives in the comfort of their countries, thus reducing transport costs to places like Canada and Russia for treatment. I would open a training facility to train some people on how to operate the machine and repair it when it's faulty.

My machine would be beneficial to the society as it will be able to cure all sorts of cancer whether breast cancer, throat cancer or even liver cancer. The treatment of tumors will be faster and effective through this machine.
