**TITLE: IF I COULD INVENT SOMETHING NEW**

Who can survive in this modern day world with olden days services? To create or invent means to make an idea or something happen or exist. If I was given the opportunity to invent something new, a lot of things would race through my mind, but one has to invent something that is beneficial to mankind. I would like to invent a biodegradable car which simply means or implies the use of manure for functionality. Many vehicles produced by man in this modern day technology have done a large deal of harm than good and examples of these harm done are poisonous gases erupting into the atmosphere, depletion of the Ozone Layer, mining of the soil to get crude oil for the production of fuel, diesel and so many others.

Firstly, the biodegradable vehicle will make use of animal manure to function thereby keeping it functional for use. So many questions would be asked and would require some answers, like won't it lead to air pollution, won't it cause the air unhealthy for human beings to inhale, the answer is no, because when the animal manure goes through some processes in the industry it would be ready for use without any other smell accompanying it. The use of this invention is that it will be using animal manure and the manure of animals will not go to waste and it is going to go through some healthy chemical processes.

Another important use of this modern day invention is that it will not emit poisonous gases which current vehicles produce in the environment. It will therefore keep the lives of animals, plants and human beings for a longer period of time. The vehicle would be programmed in such a way that there would be a backup power which would be solar energy for charging when there is no manure. It will also help to keep the environment clean from any pollution of any sort and the lives of plants and animals would be elongated because the poisonous gases would if eliminated from the atmosphere.

Lastly, the issue of global warming would be properly handled because when my idea is implemented which use fuel for functioning will be reduced and the poisonous gases will no longer be found in the atmosphere and it will also keep the world free from oxidation which affects the earth and its inhabitants. It will also protect our Ozone Layer and protect us from harsh weathers.

In conclusion, when we are given an opportunity to save and protect our world we will embrace it, that is why I came out with this idea to keep our whole universe safe from global warming and restricting the emission of poisonous gases and it will make our world a better place to live in and also protect asthmatic patients from having attacks.
