If I Could Invent Something New

Inventions require creating into existence man made items or devices which hadn't existed prior. It could also be to create a new addition or aspect to that which existed before which enable people improve lives and brings about progress.

If I could invent something for this worlds benefit, I would invent a self-cleaning vacuum machine that is capable of cleaning the air. I would love to call it Airvac. It would be made of durable and light weight materials which would be Eco friendly. The vacuum machine would provide hours of continuous cleaning without the need for recharging often as it will be solar powered as well.

The Airvac would function by capturing harmful particles in the air such as dust, pollen, pet dander, smoke, and other microscopic organism. The Airvac would come with a detachable broom stick that could slide to reach the tightest floor corners which a regular vacuum cannot. It will also have a detachable water tank used to clean the floor

This device can be used in all kinds of indoor spaces but especially in places prone to dust, air pollution. Air borne disease especially within enclosed or squared off spaces will be a thing of the past and people everywhere could breathe easier and live healthier lives.

My invention would be a game changer in the world of indoor air quality. It will serve as a robust and innovative solution that would ensure cleaner and better living spaces for people from all walks of life.
