

“If I Could Invent Something New”

Firstly, I would wish to be like other inventors like; Michael Faraday. But what I would like to invent is a machine called human scanner. It would have an access code used to operate it. My invention cannot damage easily. It would be extraordinarily strong and can be very hard to operate. The most interesting part of it is that it would use solar. It would be hard to be stolen because it uses access code and it would be remotely controlled. My invention would be the biggest technology in the world and the fastest and accurate technology. So, my name would be known throughout the world as the first inventor of human scanner. But there would be different sizes and different functions but the one that can do everything accurately is the biggest size. My invention cannot make a mistake or miscalculation.

Meanwhile, it would be able to scan one's immune system. Also, it can give tips on how to deliver a baby, how to do operation, etc. It would give a solution to any diseases or infections in the body. It would quickly analyze one's immune system without wasting much time. It would be able to tell doctors drugs that can cure diseases. It would give tips on how to start treatment in any diseases. It can be used for interview, used to ask about any medical treatment and it would give accurate answers.

Furthermore, its benefits are numerous. It would help Nigerians to depend on Nigerian Medical Association. It would go international. It would also help to reduce untimely death. My invention would be a wearable, noninvasive brain computer interface (BCI) that uses real time neutral feedback to detect early warning signs of mental health conditions. It would be equipped with advanced AI algorithms that analyze brain activity, heart rate and other physiological makers to identify patterns and anomalies that may indicate a mental health episode is imminent. It would help doctors and nurses in doing their work. So, with my invention people's lives would be saved in the world. It would help improve academic performance, increase productivity and reduce healthcare cost. Owing to the presence of not many qualified doctors, many Nigerians leave the country for health issues. They go abroad to countries like Germany, London, etc., for medical treatment. The specific objective of my invention is to save lives of people.

By way of conclusion, my invention would favor the world. It would provide early detection, personalized interventions and social support, where mental health is prioritized and supported. Individuals can thrive in all aspects of their lives.
