

“If I could Invent Something New”

So many people have created things to help in our daily activities, to make things faster, easier and reliable for us. If I could invent something new, it would be a Teleportation machine. So many people find it difficult to go to places, and also, not everybody is in good condition of health to walk.

If I could create a teleportation machine, it would save us a lot of stress. It would be in the form of an electrical headband with so many wires connected to it, which will be connected to a super computer that transports people to different places on earth. The person who is to be teleported would provide the place he wants to be teleported to. If the teleportation machine actually works; it will include some of these benefits:

Firstly, it would save us a lot of stress if we are to go places that are too far for us humans to walk to. Secondly, it would be the fastest means of transportation in the whole world, because it will be able to take you anywhere around the globe within seconds. Lastly, beyond the importance of this teleportation machine, some disadvantages may occur. If it malfunctions it might lead you to somewhere you do not know about. It may be another universe or dimension.

Furthermore, it will cost a lot of money. If eventually, I succeed in creating this machine, I will become famous like the inventors of other machines. For example, Bill Gate, the inventor of software, Penne Laennec, the inventor of stethoscope.

I also want my name to be heard as an inventor. Even if not as the first, want to be among others who have created something. My dreams are to be always remembered for making a great contribution in the world. If I pass away, I hope my invention would not. Rather, I hope it does become so famous as to be regarded as the best means of transportation.
