

**Name:** Jenye-Alalibo Asimetamunopiri

**School:** Emarid College, Igwuruta Day Campus

**Class:** JSS 3C

**Topic:** “If I Could Invent Something New”

If I could create something new, it will be a time machine. Imagine what life would be like if there is a machine that will be able to take humans back in time to explore past events. This machine will be able to make life more fascinating than it was before. It would enable children to learn a subject like history in an easier way, by experiencing past events themselves. This would give them a better understanding of what exactly happened in the past and the sequence of these events. If I could invent something new and ground shaking it would be a time machine.

“In essence, a time machine would be a device capable of transporting humans and animals to various past scenarios of life and even future events yet to take place. It would also be a source of aid to humans helping them witness past historical events or even changing the study of history. One of the most considerable advantages of a time machine would be the capacity to attain first hand information about all historical events.

Just imagine being able to experience or even witness events like the Biafran war, world war the second, the cold war, the signing of the declaration of independence and even the industrial revolution. Such participation would bring about priceless insights into the verdicts, customs and technologies that have been shaping our world.

A time machine could help historians in verifying facts and correcting inaccuracies, leading to a much more accurate and comprehensive way of understanding human history.

Furthermore, a time machine could also help in the field of archaeology. Instead of archaeologist relying mainly on artifacts and fossil records, they could watch ancient civilizations and gain deeper insights into their daily lives and technological advancements. This direct observation would improve our understanding of human emergence and the development of our societies.

Nevertheless, the invention of a time machine would partially affect agriculture in Nigeria through knowledge transfer, travelers from the future could share advanced agricultural techniques, crop varieties and technology with farmers improving yields and efficiency. A time machine would be used to introduce crops that are currently grown in Nigeria but at an earlier point in history allowing farmers to adapt and improve over time.

If a time machine is able to stop time it would potentially prevent death. With time frozen accidents and injuries would be unable to occur, preventing deaths from car crashes and other mishaps. Scientists could use these paused times to conduct extensive research and develop new treatments, leading to a significant reduction in death. Time could also be frozen during natural disasters like earthquakes, hurricanes or tsunamis allowing people to escape and seek shelter.

Time travel would have to be addressed with strict rules, which would be established for time travelers. Time travelers must accept the principle of observing events without altering them. Orientations would be given to anyone who wants to travel through time.

By enabling people explore the past and future, a time machine would provide valuable insights.
