

Topic: If I could Invent Something New

Student Name: Oluwaseun Ayodeji

School Name: Moldershand College.

Class: Junior Secondary School 3 (JSS 3)

An invention can be defined as a machine or tool created in helping the development of the country and making life easier for all of the people in the society. Many people have created many inventions which have helped in the development of the country. This phenomenon started from "Evolution" the time in which our forefathers, the "early man" started from hunting, scavenging, and which led to the discovery of fire, using caves as rocks, and sticks to calculate and Tell Time. Now, here in the 21st century, people like Thomas Edison, Nikola Tesla, Leonardo da Vinci and so many more people helped in making the world a safer place to live in.

If I were to invent something new, is an interesting topic for an essay. it gives one an opportunity to test one's creative capacity in an ever-changing world, that is moving at an alarming pace due to the power of new inventions.

For me, my focus would be to invent a device that could create massive new jobs to ease unemployment. that's the biggest challenge in Nigeria and all countries.

A new invention that could increase food production is ideal because it would bring down food prices, inflation and save millions of people from starvation. in the agricultural sector, mechanized farming can help in not just planting, but in harvesting, storing, transporting, and even exporting these agricultural goods from all across the country. This can also be applied in the fishing sector, crude oil, mining, forestry and so much more.

Apart from creating new Jobs, the quantum benefits of this on the wellbeing of the people is enormous. An increase in agricultural products would cut down our import bills, and free up valuable foreign exchange, to find other vital areas like education, health, security, technology and road infrastructure. More devices like this could help in expansion of all sectors, not just agriculture, but all sectors of economy across the world.

This is why I prefer to invent devices that could enhance food production. Industrial development needs raw materials and cash crops, and these are important sources of hard currency which would substantially meet our budgetary deficit challenges and impact all areas of the Nigerian economy.

Therefore, if I were to invent something new, I would invent agricultural machines that could help in bringing all these ideas to life.
