

## **HEIRS INSURANCE ESSAY CHAMPIONSHIP 2024**

SCHOOL: GRANDMATE SCHOOLS

NAME: OLATUNDE OLUWATOMISIN KAMSY

CLASS: JSS 1C

AGE: 11 YEARS

ESSAY TOPIC: **IF I COULD INVENT SOMETHING NEW**

Innovations, new ideas, new ways of doing things, useful improvements to solving an existing problem, or making something better or easier can be called an invention. The word “invention” comes from the Latin word, “Invenire”. Since my childhood, I have always wanted to do something that would add value to lives, so this essay gives me the opportunity to bring my ideas and thoughts into limelight.

If I could invent something, it would be a device that lets me control electricity and other critical electrical and electronic appliances with my mind. This would be an amazing ability that would change the way we use technology. No more getting up to turn on the light or struggling to find a charger. The device, called the NeuroElectro Controller, would be a special headset that uses sensors to detect my thoughts. It would read my brain signals and use them to control electrical devices. I could turn on lights, TVs, and computers just by thinking about it.

Imagine being able to control your whole home with your mind. You could turn on the coffee maker from bed, or turn off the lights without getting up. It would be like having your own superpower. You could even control the temperature, music, and lighting with just a thought.

The NeuroElectro Controller would also be helpful for people with disabilities; It would open up new possibilities for them, making their lives easier, more convenient, and interesting. Those who are unable to speak could use the device to communicate and interact with the world. It would be a game-changer for people with paralysis, ALS, or other motor disorders. They could control their wheelchairs, prosthetic limbs and even

communicate with loved ones. The possibilities are endless, and the potential benefits are huge.

In addition to its practical uses, the NeuroElectro Controller would also be a lot of fun. You could play games with your mind, or control robots and drones with your thoughts. It would be like having your own personal video game. You could even use it to create art, music and write stories.

Of course, there are some challenges to overcome before the NeuroElectro Controller could become a reality. We would need to develop advanced brain-computer interface technology, and ensure that the device is safe and secure. But if we could make it happen, it would be an incredible invention.

In conclusion, the famous scientist, Thomas Edison said, “Imagination is more important than knowledge. Knowledge is limited while imagination is limitless”. I strongly believe in the power of my imagination, so with more research and hard work, this can become a reality and not a fiction. So, if I could invent something new, it would be the NeuroElectro controller, a device which would be an amazing invention that would work with the power of imagination, turning thoughts into reality. The challenges may be much but I strongly believe we can overcome them since it would bring much ease, fun and make the world a better place.
