

# IF I COULD EVENT SOMETHING NEW

According to Oxford Dictionary it states that invention means the idea of creating that has not been made before. Right from the cave time, cave men and women invented countless of things. We are in a world of technology; before the next generation would emerge, most of man's problems would have been dealt with. Coming to the area of medicine we have many reports saying that they are overworked which is why I would be creating Robotic Nurses or more preferably AI nurses and doctors.

AI means Artificial Intelligence. What are the benefits? We are in a world of technology. The reports we are having nowadays are numerous. It would help the doctors and nurses to get their tedious job and ease their burden. It is going to be a life saver and a time redeemer. It will help us save a lot of time and enable our medical practitioners to rest enough and stay rejuvenated to tackle their tasks with minimal errors. The mistakes in the profession is on the increase and causes a lot of avoidable deaths because our medical practitioners are overbooked and their hands are few.

Not only would the AI medical practitioners help humanity and the society at large, but also the government. It would help them in the reduction of the payment of salaries. It would help the government the relief of demonstrations and protests.

Protest is an act of anger that portrays that one is not in favour of something or behaviour. Demonstration is an act to show that one is trying to prove a point through force. When government does not pay the doctors' salaries, most of them go on strike abandoning the hospitals and patients thereby making many people to lose their precious lives out of gross negligence. The government would be happy to find something like that because it would not be paying anyone's salary. Though, it would render some people jobless, the doctors could be on standby in case of any complications that may arise that those AI and robots cannot handle.

What would the doctors be doing? Most of them will still be gainfully employed working in the hospitals but majorly assisted by these AI and robotics to ease their their burden and enable them to keep on studying and making new discoveries and cures for terminal diseases like cancers that been ravaging humanity.

Not only would these devices diagnose, prescribe and treat people, they would also offer some form of care to ailing and vulnerable patients especially the aged that need constant care and patients with mental health issues which might turn violent at times. Robots wouldn't be at any risk even when patients become violent.

In conclusion, I would like to create these devices to help humanity and assist my government. It will also help us to fish out all the bad eggs in the medical profession for its benefits only without the passion for the job. In my country Nigeria, many parents force their children into the profession for the money and the prestige which causes them to be rude, arrogant and unsympathetic. This invention will drastically reduce that and allow people to stay in their God ordained profession with compassion, passion and purpose.
