

Invention refers to the creation of a new product ,process ,or idea that significantly impacts how individuals live or interact with their world .

If i had a chance to invent something new which would be very beneficial for mankind ,it would be a well made locating machine . When you just can't find one piece of your socks as a student and you really wish there was an app for finding or locating your missing socks. You would think with all the inventions already made, life would be any easier but no you are mistaken we still have not invented the gadget to tell you where your missing keys are, or where you put your pen or book that you had just a moment ago. life is so difficult with all these small things and how I have always wished I could save everyone from this misery of searching for somethings.

Economists should have a figure of how many hours are wasted searching for misplaced items. These hours would have driven the economy further forward.we all need that device that locates where our keys or remote controller and such things are hidden or where we threw them last night.

A locator has the function of identifying one or more specific elements in the DOM. A locator has a way to identify elements on a page. It is the argument passed to finding element methods.

Most of the time,the items we loose have a way of turning up and down the house. However,it's still a stressful event that many of us would like to avoid.utilizing technology that can track down misplaced items is quick solution that can help reduce the need to tear the house apart.

In conclusion I really wish and hope to make this happen.
