

IF I COULD INVENT SOMETHING NEW

Inventing is the act of constructing a device through thorough thinking, imagination and experiments which are made by inventors. The creation of inventions has been going on as early as the Paleolithic Period about 3.3 million years ago. Archeologists have found stone tools from Kenya showing that the act of constructing devices started around that time. Innovation has gone through various stages from the phonograph to audiobooks and much more and all this is due to the brain, which has still not been comprehended by science, but its impact has been made evident in the world around us. Innovation has become a force that has improved in some areas but has unfortunately started to slowly destroy the perfect world we live in.

In this current situation the world is facing, inventions, which can salvage the mess that our so-called "wisdom" has brought us into, need to be created. The biggest problem we are facing now is the continuous emission of greenhouse gases also known as climate change. According to the National Aeronautics and Space Administration (NASA), the past four years have been the hottest globally and this is due to the continuous emission of CFC (chlorofluorocarbons), HCFC (hydrochlorofluorocarbons) and CO₂ (Carbon dioxide) in which is the most emitted. According to the World Economic Forum, China, the number one polluter of greenhouse gases, had a dramatic plummet in material production during Covid-19 pandemic, therefore the amount of pollution globally decreased by thirty percent. This problem can be better salvaged by creating tree-planting drones, this will reduce the amount of carbon dioxide in the atmosphere by twenty-five percent. That is enough to negate about twenty years of human-produced carbon emissions at the current rate or about half of all carbon emitted by humans since 1960.

These gases, though helpful, has started to destroy our ozone layer and heat up the world; the chart below shows the amount of pollution in the atmosphere and how they are emitted.

The Amount of Pollution in The Atmosphere

This invention can be achieved by using a drone with a container that has seeds covered in carbon capsules (that will help in the seed-fertilization) which will be fired into plant-free areas, that the drone will capture through sensors depending on the species. Then the drone will be brought daily to water the soil so growth can take place and most of the carbon dioxide in the atmosphere will be used as energy for the trees that will be planted, therefore, making the earth nature friendly and reducing climate change giving the ozone layer a better chance to repair itself.

I believe my new invention can reduce global warming, giving humans a more suitable way to do that, as humans are prone to do anything as long as technology is involved, and it is time efficient meaning multiple things can be done while flying it, therefore, giving it a higher production rate.
