

IF I COULD INVENT SOMETHING NEW

If I were actually given an opportunity to invent something that could be very useful to everyone, it would be a private aerial vehicle. In the past, people traveled only on horses, donkeys, camels, or just on foot. After the car was invented, it fundamentally changed everything. Most people started to use cars more than any other means of transport. These days, cars are the most common cause of traffic jams, which have increased with the use of a great number of cars. That is why, in the most fundamental respect, I would like to invent a private aerial vehicle.

First of all, my invention would help reduce drivers' stress caused by traffic jams. As forces in equilibrium show, traffic jams are increasing in big cities, and even in smaller ones, particularly during business hours when everyone is in a hurry to get to their workplaces. Some people would prefer to drive the aerial vehicle instead of ordinary cars. The combination of land and aerial vehicles for private use would definitely help to alleviate traffic jams.

Secondly, with the successful implementation of this invention, there could be a decrease in car accidents. Most times, drivers are not fully aware that they violate traffic laws even for genuine reasons. They violate the laws because they are in a hurry to meet a deadline or they are simply ignorant of the meaning of road signs, etc. In my opinion, there is only one solution to these problems: a private aerial vehicle.

While the idea of everyone owning an aerial vehicle is fascinating and potentially transformative, it comes with several significant disadvantages such as safety concerns, proper pilot training, emissions, noise pollution, infrastructure requirements for landing and takeoff, regulatory and legal issues, and the impact on existing transportation systems. Despite these disadvantages, the advantages could still have a much greater effect on people's lives, such as a decrease in car accidents and a reduction in the use of insulting and vulgar words.

As a final point, it would also be a source of light-hearted enjoyment. We have often encountered the concept of aerial vehicles in science fiction or Hollywood films. It is clear that it is interesting and most people would want to try it themselves.

In conclusion, I would like to change the stressful atmosphere in which people waste time in traffic jams. Instead, they could spend time with their family or friends. This invention would be very useful, beneficial, and favorable, and it would also have a positive effect on people by helping them avoid stress and enjoy traveling.
