

If I Could Invent Something New

My name is Daniel Amuzienwa, an eleven-year old JSS1 student, studying in the school; The Cuddles Hall. With a great passion for science and engineering, I draft this essay on my take on the topic **'If I Could Invent Something New'**. This is written specifically for the competition from the Heirs Insurance Group, which enhances creative minds and development. This write-up will contain encompassing information on the topic with detailed paragraphs as written below.

I have always wished to become an inventor like my role model, Mark Rober (a fastidious American engineer) who has made arrays of inventions which have inspired me to be like him. If I could invent something new, it would be eco-friendly yet social, it would be needed by the public. It will have the ability to combat and extricate the globe from security threats and other dangers threatening an individual's life and property. To get this, I will definitely need creativity and imagination for a better outcome, there as, I gladly introduce my dream invention which I am sure will mitigate insecurity in our country; the Secmac. This *'yet-to-be-made'* invention will have the ability to curb crime, protecting lives and property as mentioned earlier, but what does it look like ? How does it work ? These questions will be answered in detail, infra.

Secmac, a 12-inches AI specialized robot, endowed with the ability to detect any crime event happening in a location. Its cuboidal form and size enables an imperceptible form disguising it from the crowd. Equipped with a highly portable camera, it has the aptitude to video conversations, sending it to a security agency that it is connected to, via a network due to its communicability. Its intelligent AI equipped sensors and a built-in human language program facilitates its understanding of human perception, allowing it to separate normal dialogue from probable crime conversations. This robot could be put anywhere for it easily adapts to the surroundings learning human movements, whilst still undetectable. It is also immune to various weather conditions.

With the features of this innovative machine stated above, I am certain that it will be aggrandized by the public. This invention will greatly change the face of crime in the society, especially Nigeria. Once again, crime will be curbed, reducing life risks, because of my invention and it will be a pleasure to hold that position.

In conclusion, in accordance with the aforementioned, are my pieces on the topic **If I Could Invent Something New.** With determination and curiosity, I will be able to make

the words of this essay come to life. Even as arduous as it may seem, I am assured that the Holy Spirit will guide me in this path.
