

NAME: CHUKWU DELICIA KANYIMARACHI

CLASS: JSS3

SCHOOL: NIGERIA KOREA MODEL SCHOOL

IF I COULD INVENT SOMETHING NEW

There are many great inventors that have contributed a great deal to the world's technological evolution. Many great inventors such as Blaise Pascal, Joseph Jacquard, Thomas Edison and let us not forget the father of all computers, Charles Babbage and the creator of windows, Bill Gate.

We also have marvellous inventions created by these wonderful inventors such as the difference machine, the analytical engine, the Electronic Numerical Integrator and Computer (ENIAC) and so many others. Where the world is today technologically all started from the Stone Age that gradually developed into the Iron Age to the Bronze Age to the middle age, which led to the industrial age, and all these brought us to this new technological era the electrical age. These stages gradually developed in five (5) stages: The invention of Language, people were able to express themselves and communicate freely using different languages, The Invention of Printing, in this stage; printed information were documented which had a wide reach and access. Invention of MSS Mass media; radio signals went across seas, oceans, and other countries. Sophisticated mass media inventions or machines were developed. These include but not limited to transformers, antennas, cellular radio and many others. Invention of Information Technology (IT): Charles Babbage's work on the difference machine and the analytical engine with computer, which can process variety of information simultaneously. These five stages led to the world we see before us today.

Now, where am I heading to, we are all aware that technology is the key to a brighter and better tomorrow, which brings us back to the question if I could create something new? If I had the opportunity of creating an invention, it would be a machine that could help in the medical sector I would create a device or robot that helps the doctors check in on patients that have very contagious and dangerous diseases such as Ebola, Covid 19 and the likes without having physical contact with such a patient. This piece of invention will have the capacity and functionality of checking the temperature, pulse of the patient and other vitals of the patients from a remote distance. The sole aim of this invention is to reduce the prevalent risk doctors and other health workers are exposed to in their effort to save lives. It actually broke my heart that many of our trained medical personnel became victims of some ravaging disease outbreaks. If I have the opportunity of inventing this device /robot I am sure I would have contributed in no small measure in making the work place of our medical personnel much more safer and conducive for all. This my invention would be called "The Self Check-up Device (TSCD)". It is my desire that this my TSCD will be in used in every hospital around the world and through this I will be counted among the league of great inventors in the world.
